Magic camera app download apk

The cameras on smartphones are much larger than they were. Businesses are chomping to the bit to make their cameras more reliable, better operate in low light, and add features that people want. Many base their purchasing decisions on the strength of the camera. The fact is that cameras are important on mobile devices these days. Usually this makes stock camera applications better than third-party applications. OEMs simply know better the configurations of their cameras and optimize more appropriately. This is especially true for Google, Samsung and Huawei phones that use AI and other software optimizations in conjunction with camera hardware. However, a third-party application may be useful in some scenarios. Here are the best camera apps for Android! Finally, keep in mind that new versions of Android can force the use of the stock camera app anyway. It's just something to keep in mind. We also recommend Motion Cam (Google Play Link) as an honorable mention because it has some neat ideas, but it is in beta from the moment of writing. Related: A Better CameraPrice: Free / \$0.99A Better Camera is a surprisingly rugged camera app. It features support for HDR images, up to 360 degree panoramas, various multi-shot modes, night mode, and, of course, video recording features as well. The quality of the photo is actually pretty good and it has some extra features like removing objects in case you get a car or something in your accident photo. The pro version also unlocks some additional features. This one is a bit old and hasn't seen an update since 2018. However, if the developer is actively supporting it, this one deserves to be on this list. Adobe Lightroom and Adobe Photoshop CameraPrice: Free / \$52.99 per monthAdobe Lightroom is technically a photo editor and not a camera app. However, it also comes with a built-in camera app. The camera is reasonably decent and includes great keyword features like HDR, RAW support, and various modes and presets. Plus, it has the usual range of manual camera controls if you need it as well. The good news is Adobe Lightroom is one of the best mobile photo editor apps right now so you can use the camera app and immediately bounce back into editing. Adobe also launched Adobe Photoshop Camera (Google Play link) in 2020 with a variety of features including various filters, real-time Photoshop effects, portrait mode controls, and more. It's mostly a camera for social media types, but it's still a decent option overall. Bacon CameraPrice: Free / \$1.99We will be honest. We thought bacon camera was a joke app when we saw the name for the first time. However, this is a legitimately decent camera app. It features manual controls such as focus, white balance, exposure compensation, ISO, and more. You also get support for RAW and DNG as well as the traditional JPEG. It has support for manual controls on devices that don't support Google's Camera2 API. We didn't have any test devices that didn't support that, so we'll be speaking out on it for now. Others include GIF support, panorama mode and timely shots. It's surprisingly good and the pro version is surprisingly cheap. MXPrice: Camera: Free/ Up to 1.99 \$Camera MX is one of the oldest and most popular camera apps. Developers update the app regularly and keep it up to date. It works best for simple things. The app has a variety of shooting modes. You can also use it to take photos or videos. There's even a GIF mode to create your own GIFs. The built-in photo editor can also lay the groundwork. It's a decent all-in-one solution. Serious photographers may want to look elsewhere. You can also use the pro version of this as part of the Google Play Pass if you have it. CymeraPrice: Free / Up to 3.49 \$Cymera is another of the older and popular camera applications. It focuses more on consumer features. This means you'll get a bunch of filters, stickers, special effects, and similar features. It also features a beauty camera mode. It can add or remove features of your face and body. We are not big fans of these dramatic changes, but to each their own. It also includes a photo editor for minor changes. It's free to download. You can buy extra things in the form of in-app purchases. Filmic ProPrice: \$14.99 - \$9.99Filmic Pro is one of the newest camera apps on Android. It is also the most expensive camera app on this list. It has some unique features as well. This includes extremely specific manual controls. For example, it has a double cursor for exposure and focus, a white balance adjustment matrix, and gamma-curve control. In addition, it comes with a few extra scans, live RGB control, and much more. This one had a very fragile start. However, developers seem to actively take user feedback and update the app to fix bugs. We hope it will be good one day. Be sure to test this one thoroughly within the refund period if you want to try it. Google CameraPrice: FreeGoogle Camera is Google's official camera app. This is the one you'll find on most Google devices. It has a small but effective set of features. They include a lens blur mode, slow motion (on supported devices), photo spheres, video stabilization, and more. The only downside is compatibility. You can only use it on devices running Android 7.1.1 and more (at the time of writing). Same later, only the most current Android devices will be able to use it. Otherwise, it's free and it's really good. However, if you want the best Google Camera features, you may need to sideload a modified version for your device. Open CameraPrice: Free / \$1.99Open Camera is one of the most popular camera apps for serious photographers. It has most of the serious features that we have discussed before. This includes manual camera controls. It also includes an update, support for some external microphones, HDR, exposure bracketing, and more. It's also a great option for photographers and videographers. The app is completely free without in-app purchases or advertising. It's also completely completely Source. It's always a plus. There is an optional (and separate) donation application if you want to support the developer. PixticaPrice: Free / \$3.99 per anPixtica is one of the newest camera apps on the list. It has a bunch of neat little tricks and some decent post-processing. Some of the features include live filters, manual controls, exposure control, a GIF recorder, slow motion mode, RAW file support, a QR code scanner and more. It even comes with a very basic gallery and photo editor. We love its wide range of features and its all-in-one style. However, it does require a subscription for some of the features and your stock camera app can probably still do post-processing better. ProCam XPrice: Free/\$4.99ProCam X is one of the newest camera apps on the list and it does a pretty reasonable job. It focuses more on professional features rather than social media-style filters and stuff. The app includes burst mode, facial recognition, 4k video recording support, and RAW support. In addition, there are manual controls (if your device supports it), the ability to turn off the shutter sound, and some camera modes such as a scene mode or focus mode. It hits a lot of checkboxes for a good third-party application and the post-processing isn't half bad. In addition, the premium version is not that expensive. SayCheesePrice: Free / Up to \$13.99SayCheese is another type of camera application. This is a remote camera application with some neat features. It allows you to connect to a friend's phone and take pictures with their camera on your device. This is a great solution for situations where you want to take a group photo, but don't have someone to do it for you. The app is in early access beta at the time of writing so there are a few bugs. However, it worked very well in our tests and we assume that more updates will add more stability. Simple CameraPrice: FreeSimple Camera is, well, a simple camera app. It has a no-frills user interface and it's not bogged down with a ton of extra features. You can take pictures with the front and rear cameras, change where the photos are recorded and limit the resolution if necessary. That's about it, really. We do not recommend this for people looking to improve their photos. However, we recommend it to someone who is constantly confused and irritated by the complexity of the camera applications are don't mind a dip in the quality of the photo for something simple that just works. We recommend Google Camera before that, but it's another decent, super minimal option without a lot of frills. Snap Camera HDRPrice: Free / \$1.99Snap Camera HDR is a good between serious and amateur photographer types. There is support for manual camera controls, 4K video recording, RAW support, HDR and file size options. It also includes fun shooting modes, effects, borders, color effects and thumbnails. There are camera apps that do manual controls a little better and apps that make filters fun and a little better. It is rare to find an application that does both as well as this one. Be sure to try the free version before you buy the pro version. VSCOPrice: Free with in-app purchases / \$19.99 per yearVSCO is a popular camera app and a bit powerful and photo editor combo. The camera side is a bit simple and not as powerful as your native phone camera app or others here. However, the photo editor side is among the best in the entire mobile. It has a variety of filters, effects and settings. In addition, it has most of these same videos for video content as well. Perhaps its most unique feature is its ability to mimic a host of other cameras. This application does become quite expensive, however, and many of its most desirable features are behind a payroll of \$19.99 per year. Your stockPrice camera app: FreeEvery phone comes with its own camera app. You should definitely give this application a fair jolt. Manufacturers are developing these applications specifically for the camera on your device. There are often features these apps have that others don't. For example, manual focus in the LG V50 does everything that is in green focus glow. So you can visually see where the camera is concentrated. We really only recommend changing your camera app to extend your feature set rather than replacing it. Each application on this list does better when used next to the stock camera app. You usually leave features at the door if you don't use them. If we missed one of the best camera apps for Android, tell us about them in the comments! See all our best lists of apps and games here. Also, we would like to wish goodbye to Moment Pro Camera. She was an excellent participant on this list as it lasted. Lasted.
